An aerial photograph of a large industrial facility, likely a mine or processing plant. The facility consists of several long, rectangular brick buildings with multiple chimneys. In the foreground and middle ground, there are several large, irregularly shaped water reservoirs or ponds, some of which appear to be filled with a light-colored, possibly mineral-rich liquid. The surrounding area is a mix of green grass and dense forest. The sky is clear and blue.

From Exploration to Closure: Utilization of an Integrated Mine Water Model in all Phases of the Mine Life Cycle

Tina Pint and Peter Hinck, Barr Engineering Co.

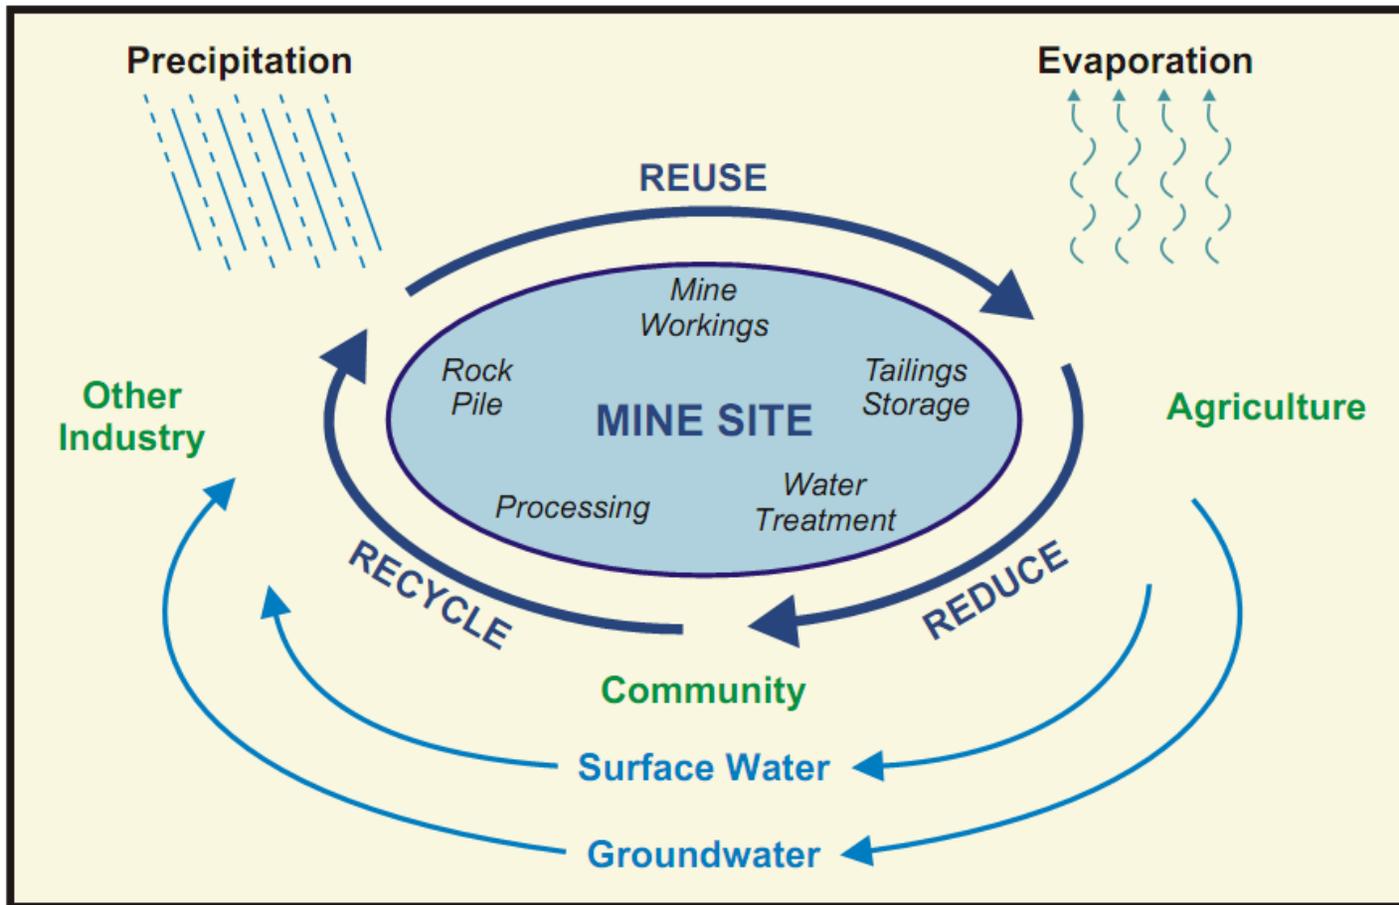

outline

High level discussion of why an integrated mine water model is beneficial

Project example of the use of an integrated model for mine planning

mining and water management

modeling of complex systems

The complexity in water management strategies and the iterative nature of mine planning necessitates integrated water models during all phases of the mine life cycle

integrated mine water models

- a model that includes key mine features or processes that could effect water quantity or quality and the eventual receptors of the water
- the more you can get into a single model the better

aspects included in a integrated water model

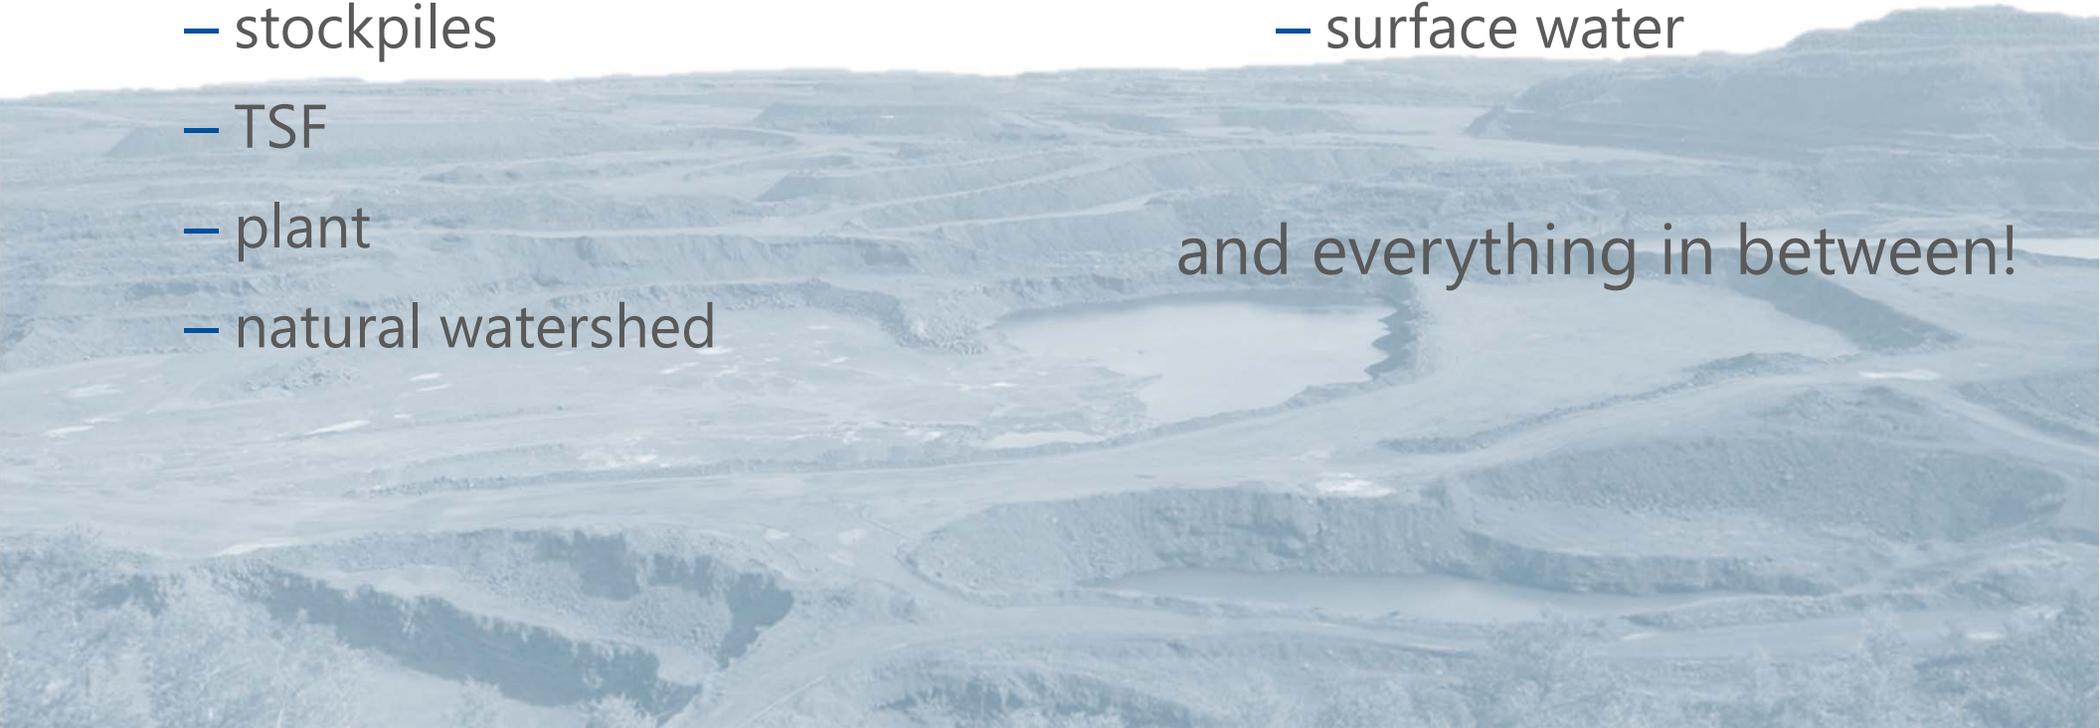

■ sources:

- pits
- stockpiles
- TSF
- plant
- natural watershed

■ receptors:

- groundwater
- surface water

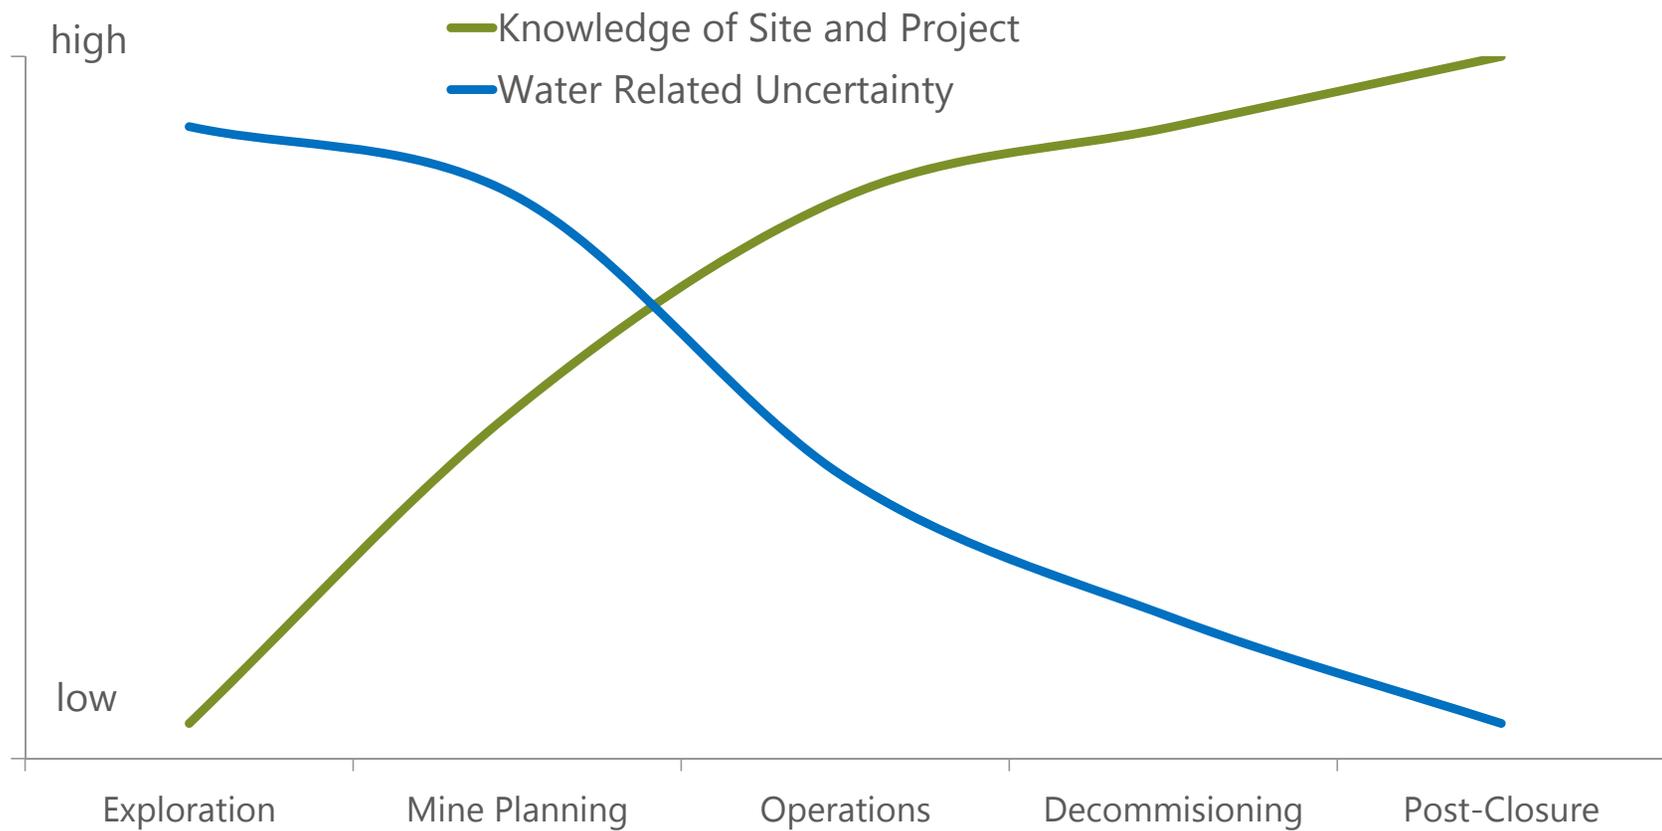

and everything in between!

mine life cycle

knowledge and uncertainty through the mine cycle

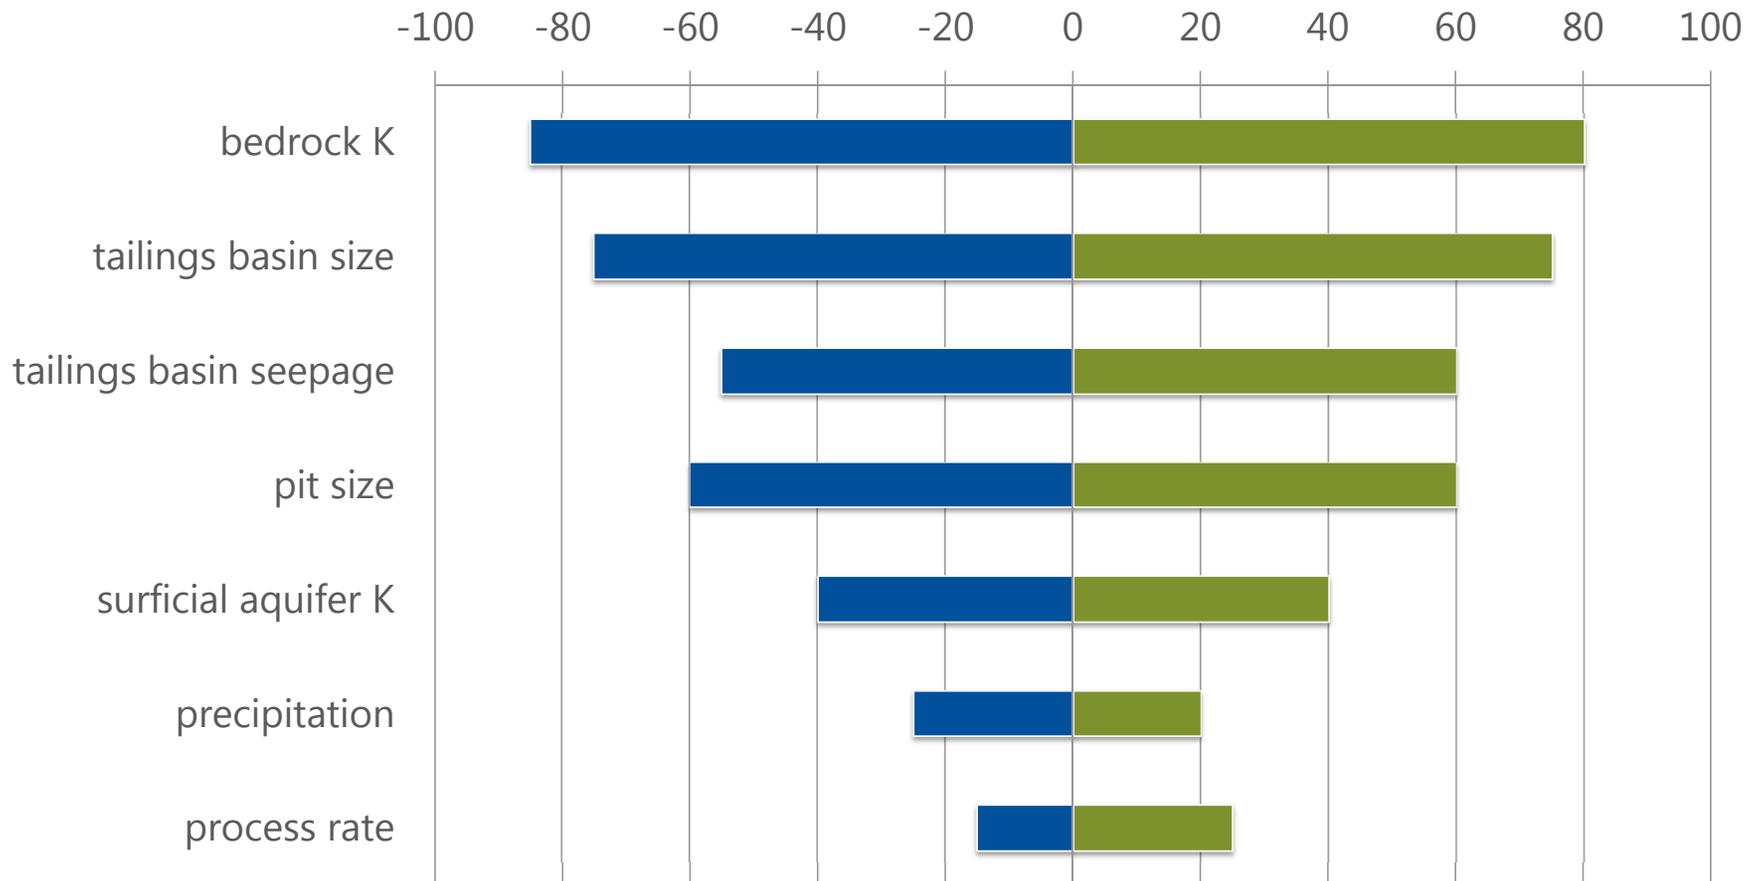

mine life cycle

water modeling in feasibility – start simple

- data to support NI43-101 reports
- preliminary water balance and geochemical assessment
- what are the key drivers of desired outcomes?
- what water related controls are likely to be needed?
- where will collecting additional data significantly reduce uncertainty?

modeling to guide data collection

mine life cycle

water management modeling – mine planning

- Refining the water management plan
- Support environmental review
- Demonstrate regulatory compliance
- Provide data for permitting

mine life cycle

water management in operations

- How do you manage water to maintain operations?
- How do you manage water to meet permit conditions?

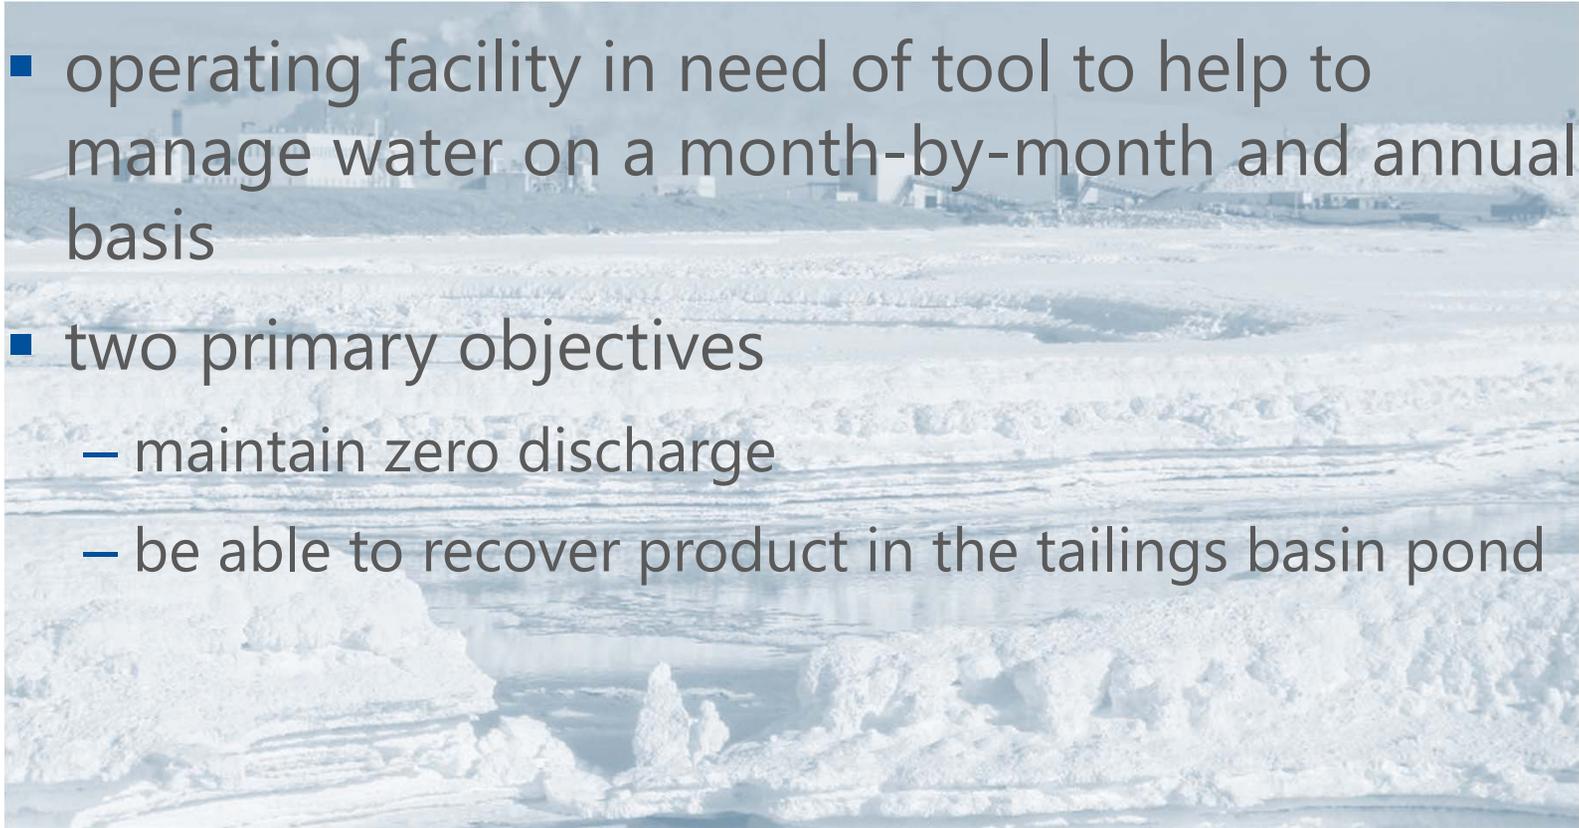

operating mine – Western US

operating mine – Western US

- operating facility in need of tool to help to manage water on a month-by-month and annual basis
- two primary objectives
 - maintain zero discharge
 - be able to recover product in the tailings basin pond

Ponds Management Tool – setup

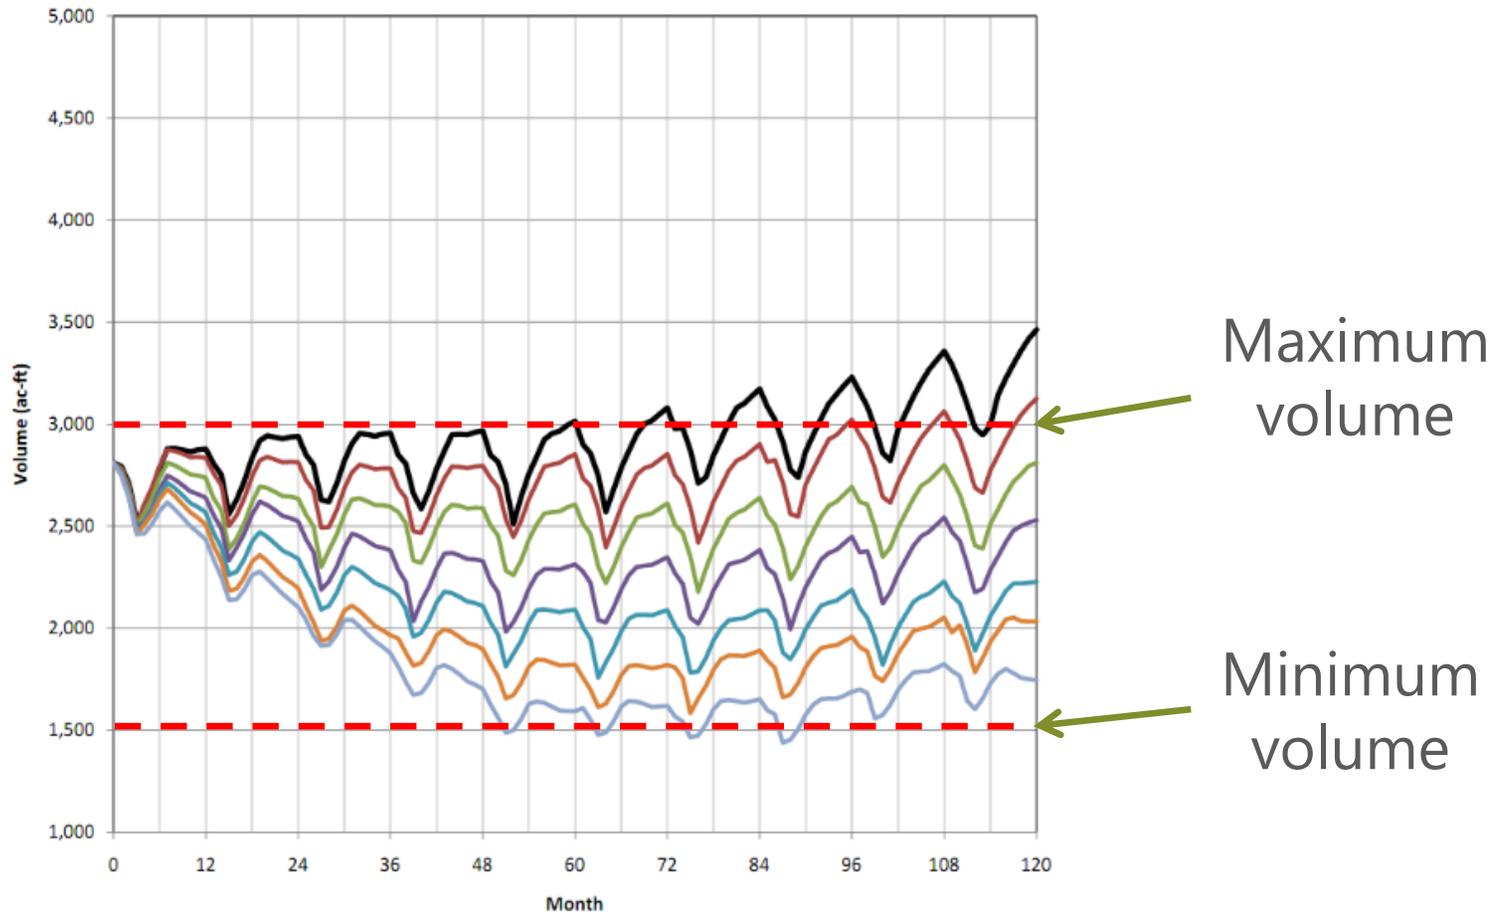

- built a tool that incorporates plant production, tailings management, water management, and ponds
- used to help determine when, where and at what rate to pump

Ponds Initial Conditions

<input type="text" value="6245.2"/>	<input type="text" value="6333"/>	ft	Starting water elevation
<input type="text" value="6245.5"/>	<input type="text" value="6330.8"/>	ft	Starting product elevation
<input type="text" value="6250 ft"/>	<input type="text" value="6345 ft"/>		Operating Elevation
<input type="text" value="6255 ft"/>	<input type="text" value="6255 ft"/>		Overflow Elevation
<input type="text" value="390 acre"/>	<input type="text" value="198 acre"/>		Water Surface Area at Operating Elevation
Pond 3			
<input type="text" value="8"/>	ft		Initial Depth of Product
<input type="text" value="9"/>	ft		Initial Depth of Water

Ponds Management Tool – output

mine life cycle

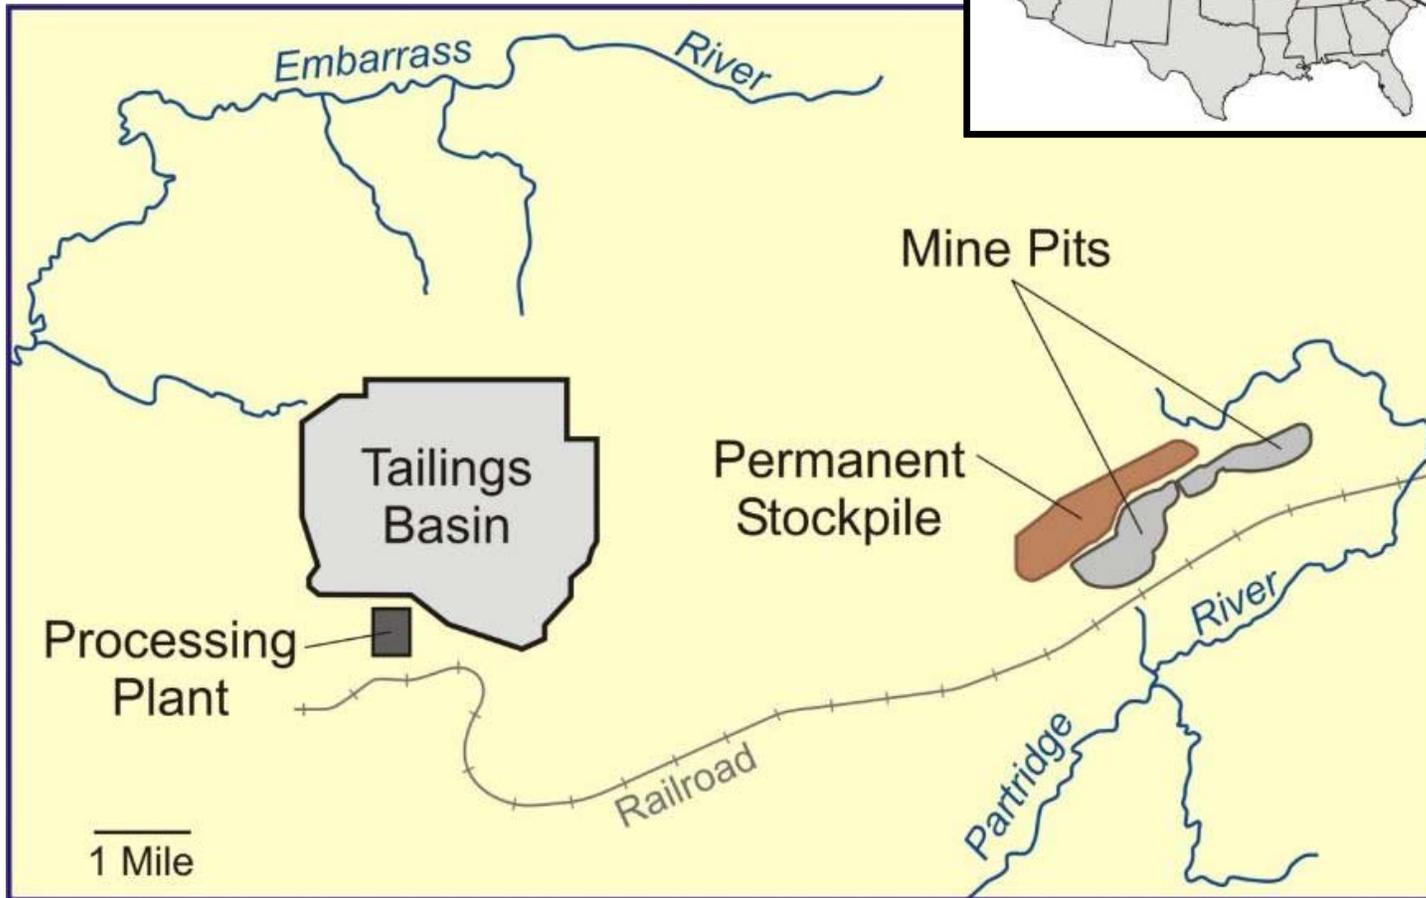

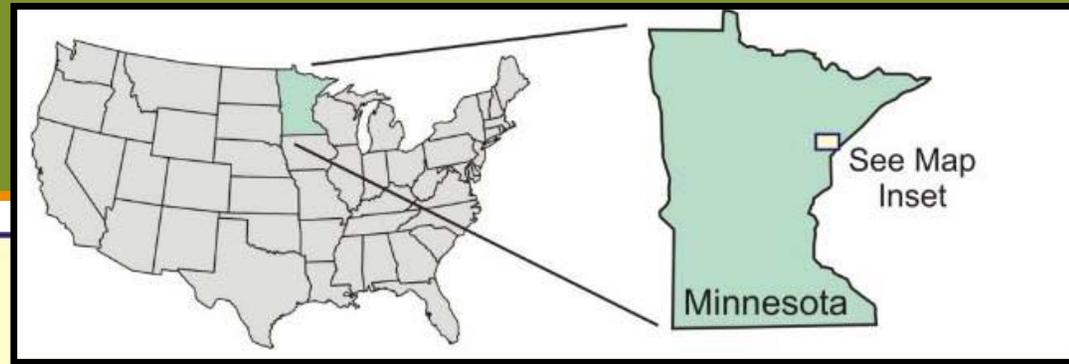

water management in reclamation

how can you manage water to reduce liability and long term maintenance

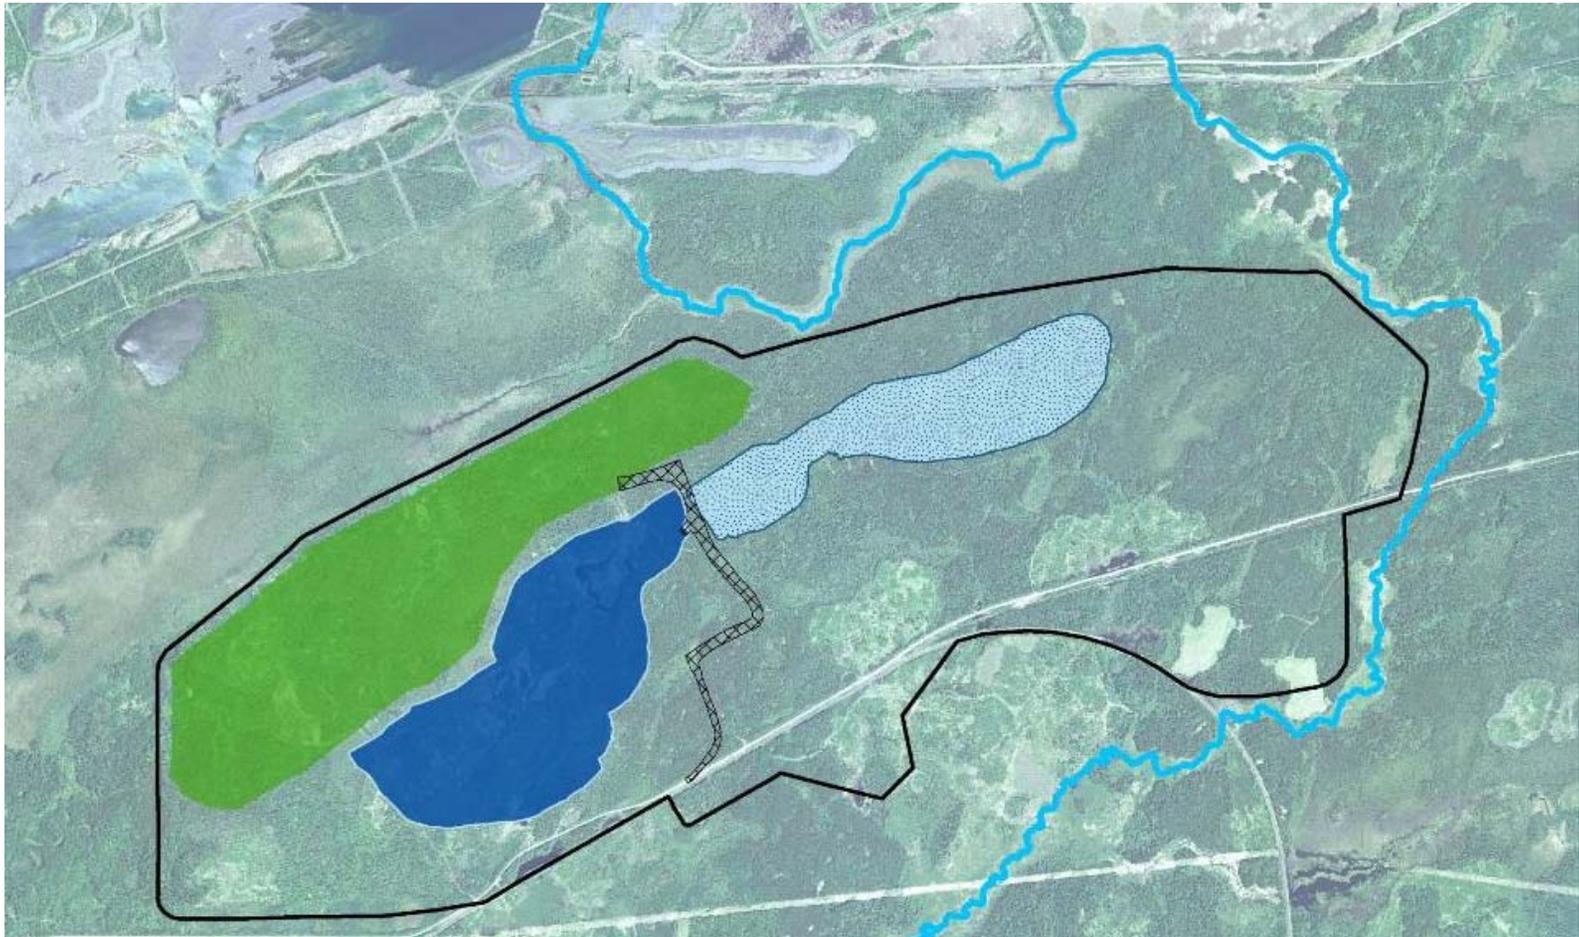

mine planning example

NorthMet mine site - operations

NorthMet mine site – closure

NorthMet plant site

- processing plant
- tailings storage
- hydrometallurgical residue storage
- water treatment

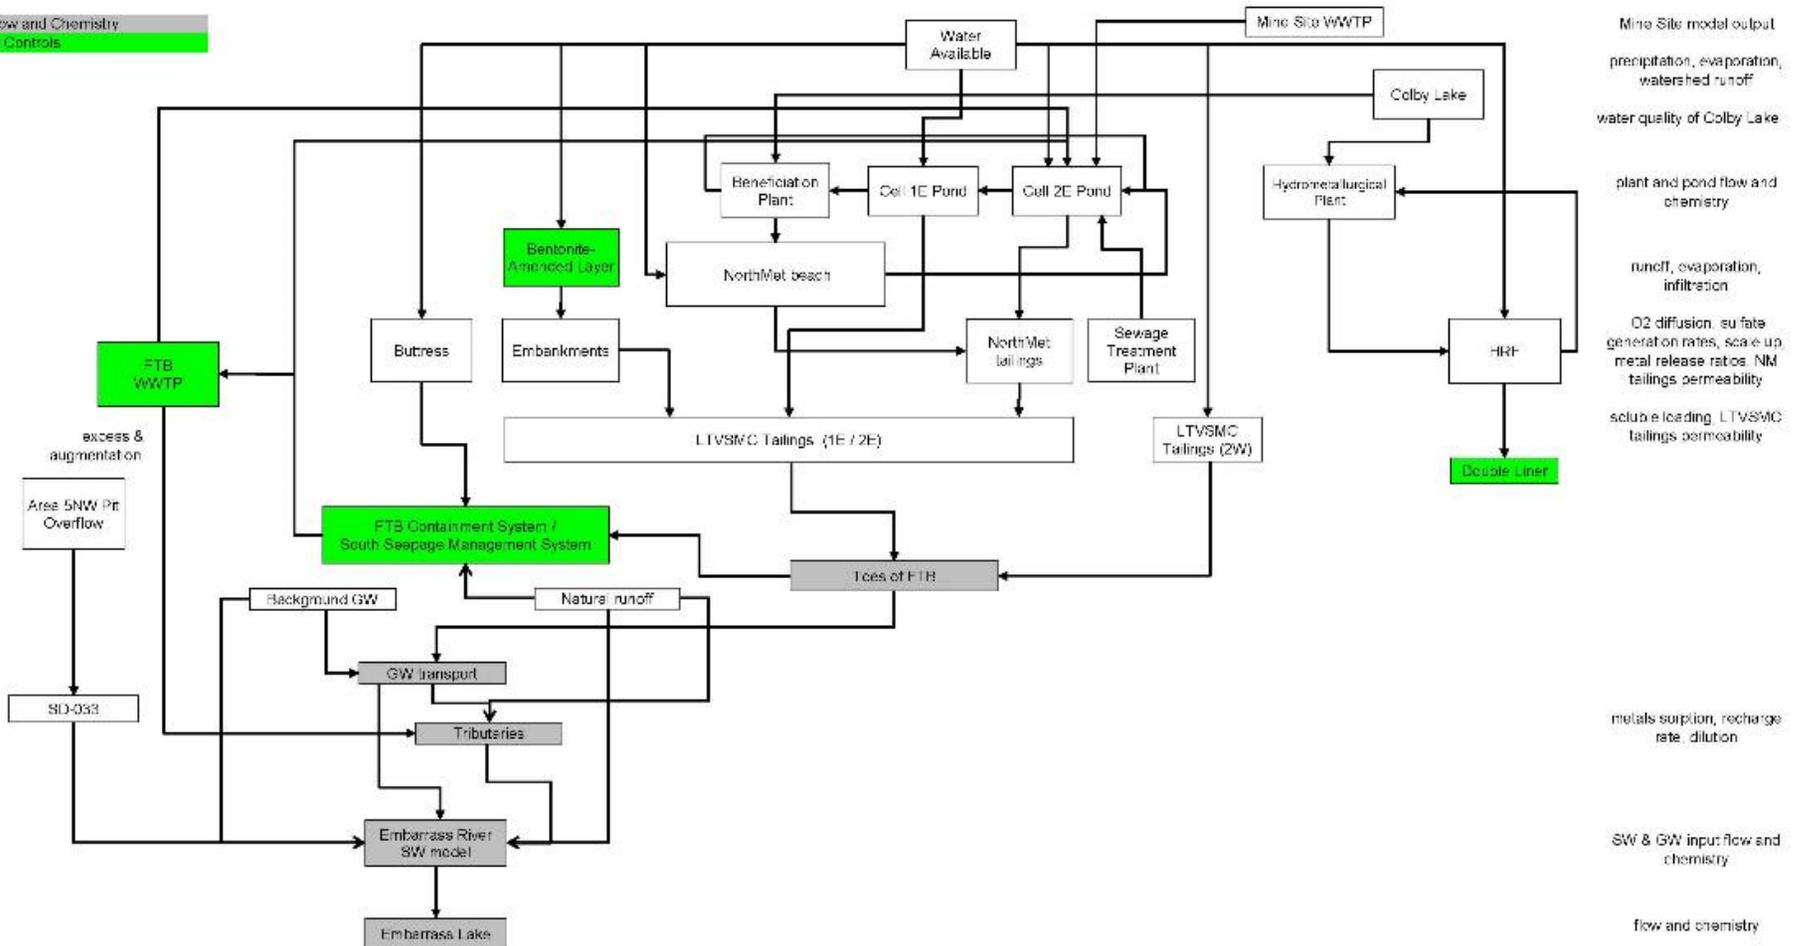

Water management strategy

- Collect water from the mine site (pits and stockpiles) and pump to the plant site for use in processing
- All seepage from the TSF will be collected and reused to the extent possible
- Additional make-up water will come from nearby lake as required

integrated water balance

Large Figure 10 - Tailings Basin Water Modeling - Operations (early years)

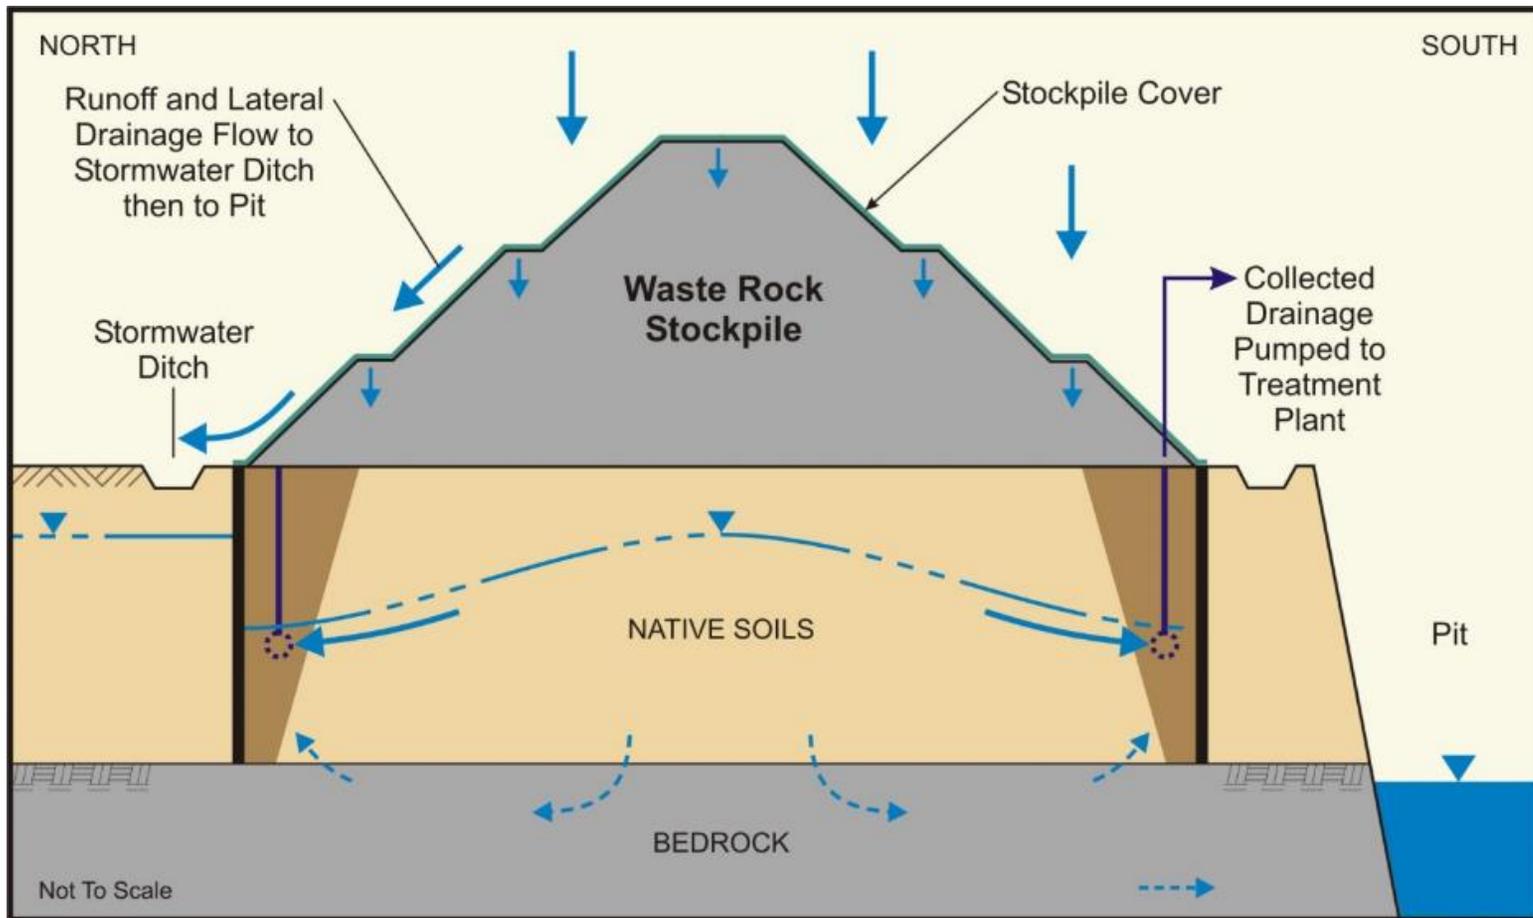

Outputs - Flow and Chemistry
 Engineering Controls

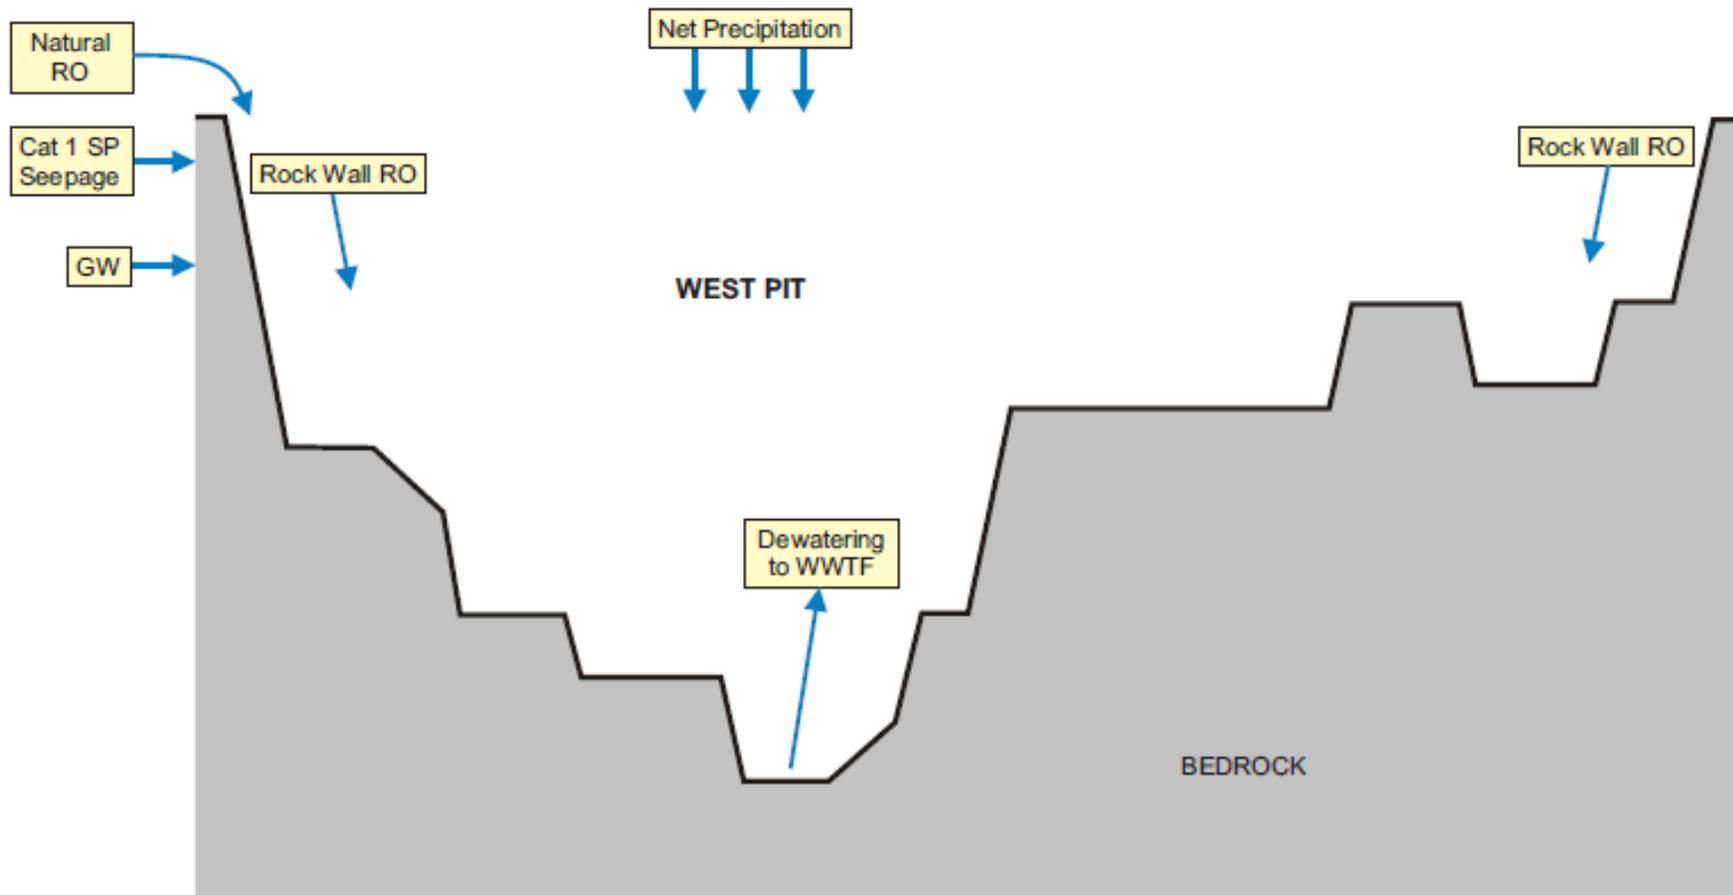

modeling overview

- two linked GoldSim models that go from source to receptor
- transient through time from operations through post closure
- simulate water quantity and quality (20+ constituents)

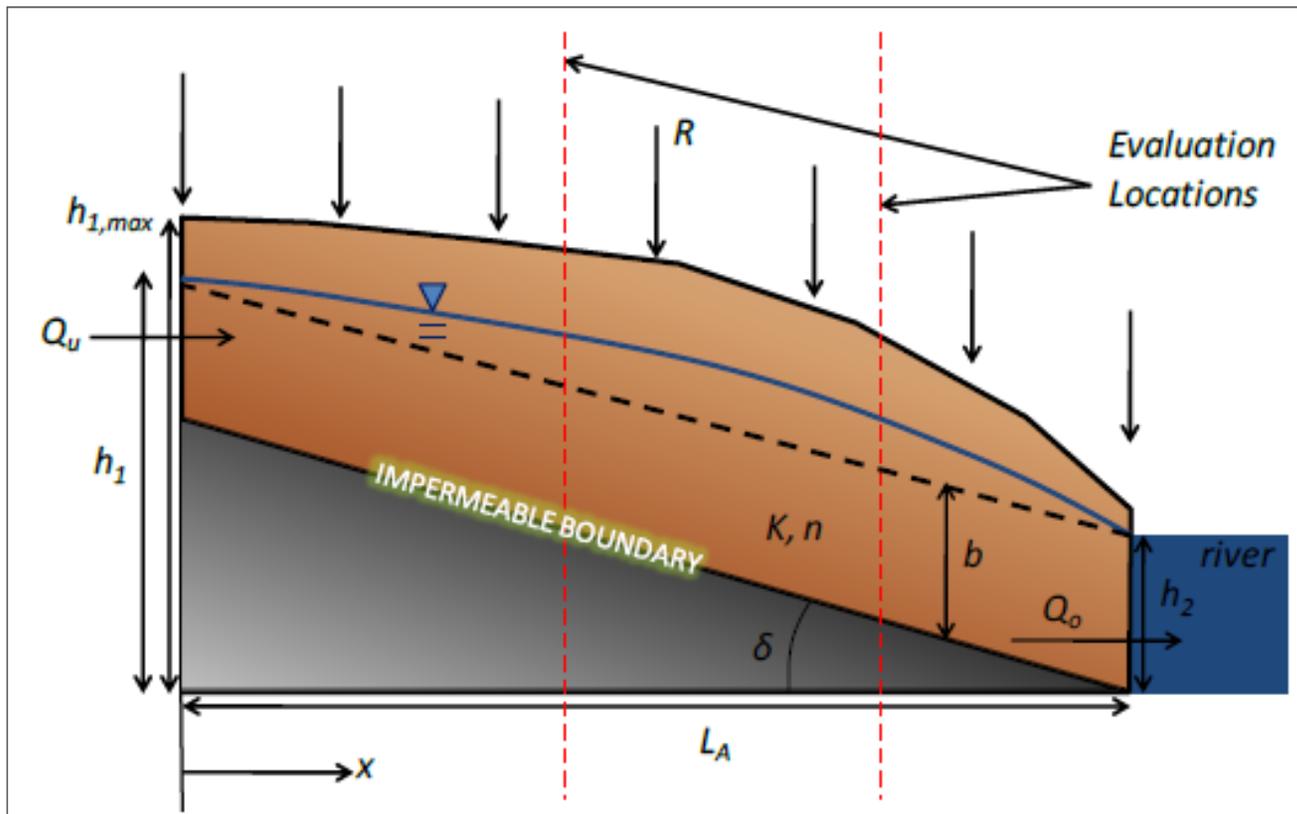

waste rock submodel

mine pit submodel

groundwater transport

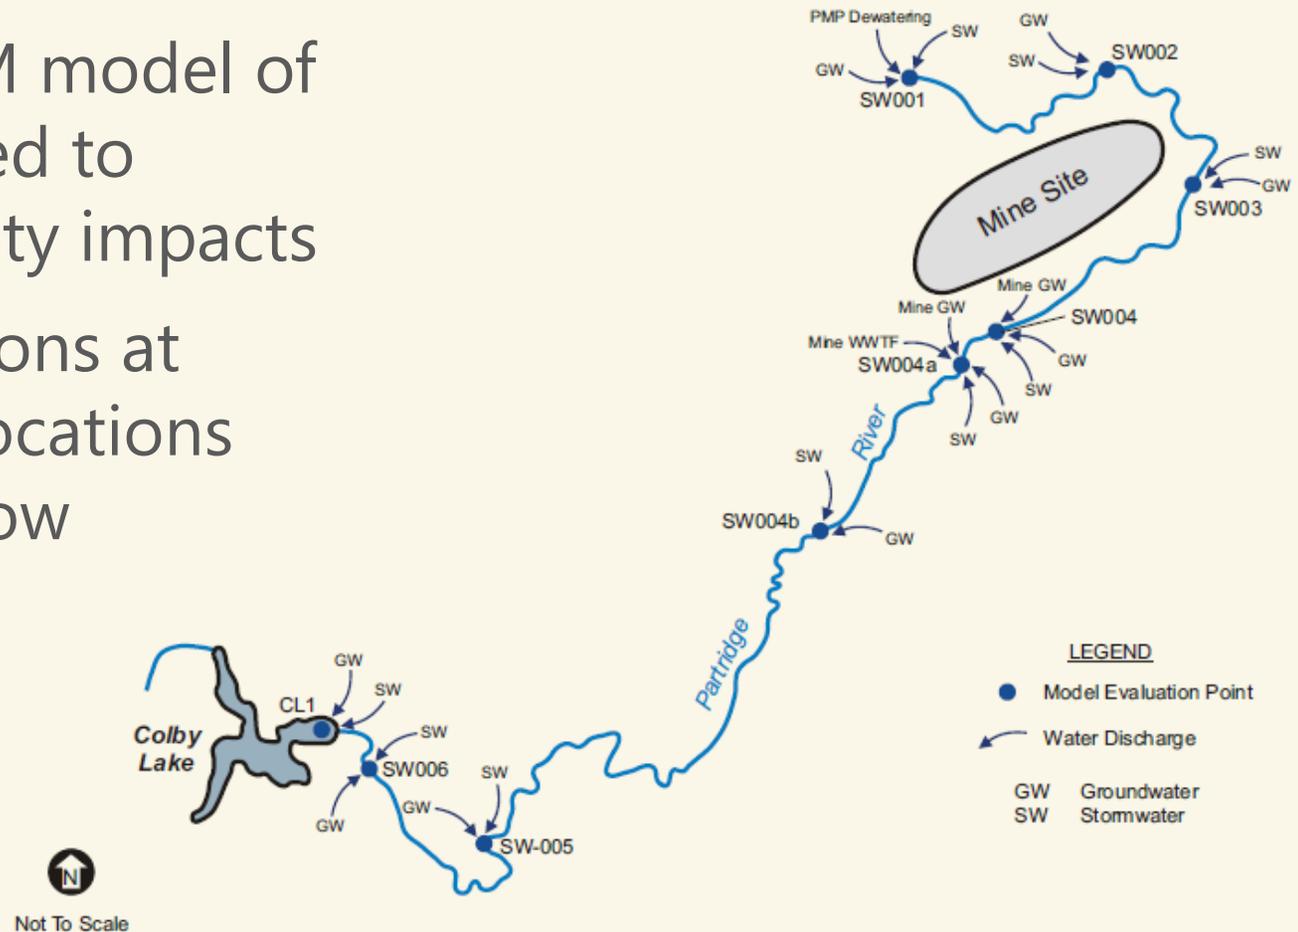

Simulate 1D flow with:

- advection
- dispersion
- sorption
- aquifer recharge

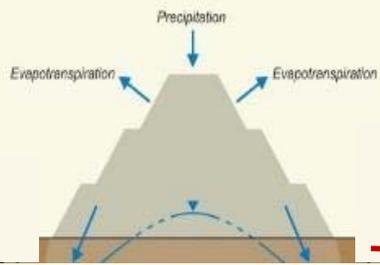

surface water submodel

- based on XP-SWMM model of river system designed to predict water quantity impacts
- predicts concentrations at various evaluation locations under a variety of flow conditions

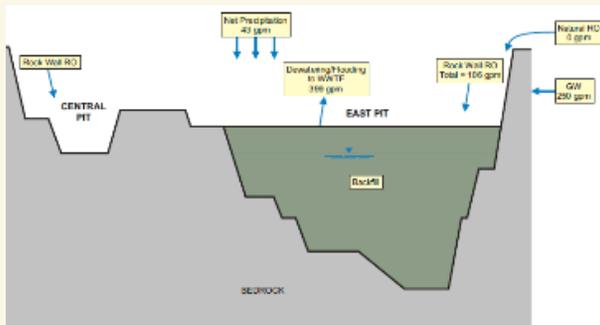

linked source-to-receptor model

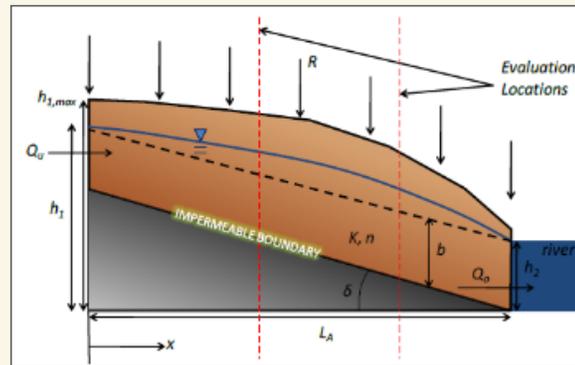

Waste rock geochemistry

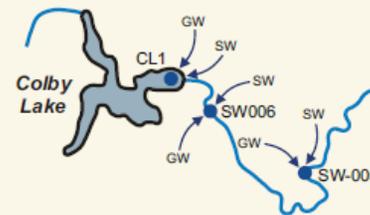

Pit water/mass balance

Groundwater transport

Surface water transport

LEGEND

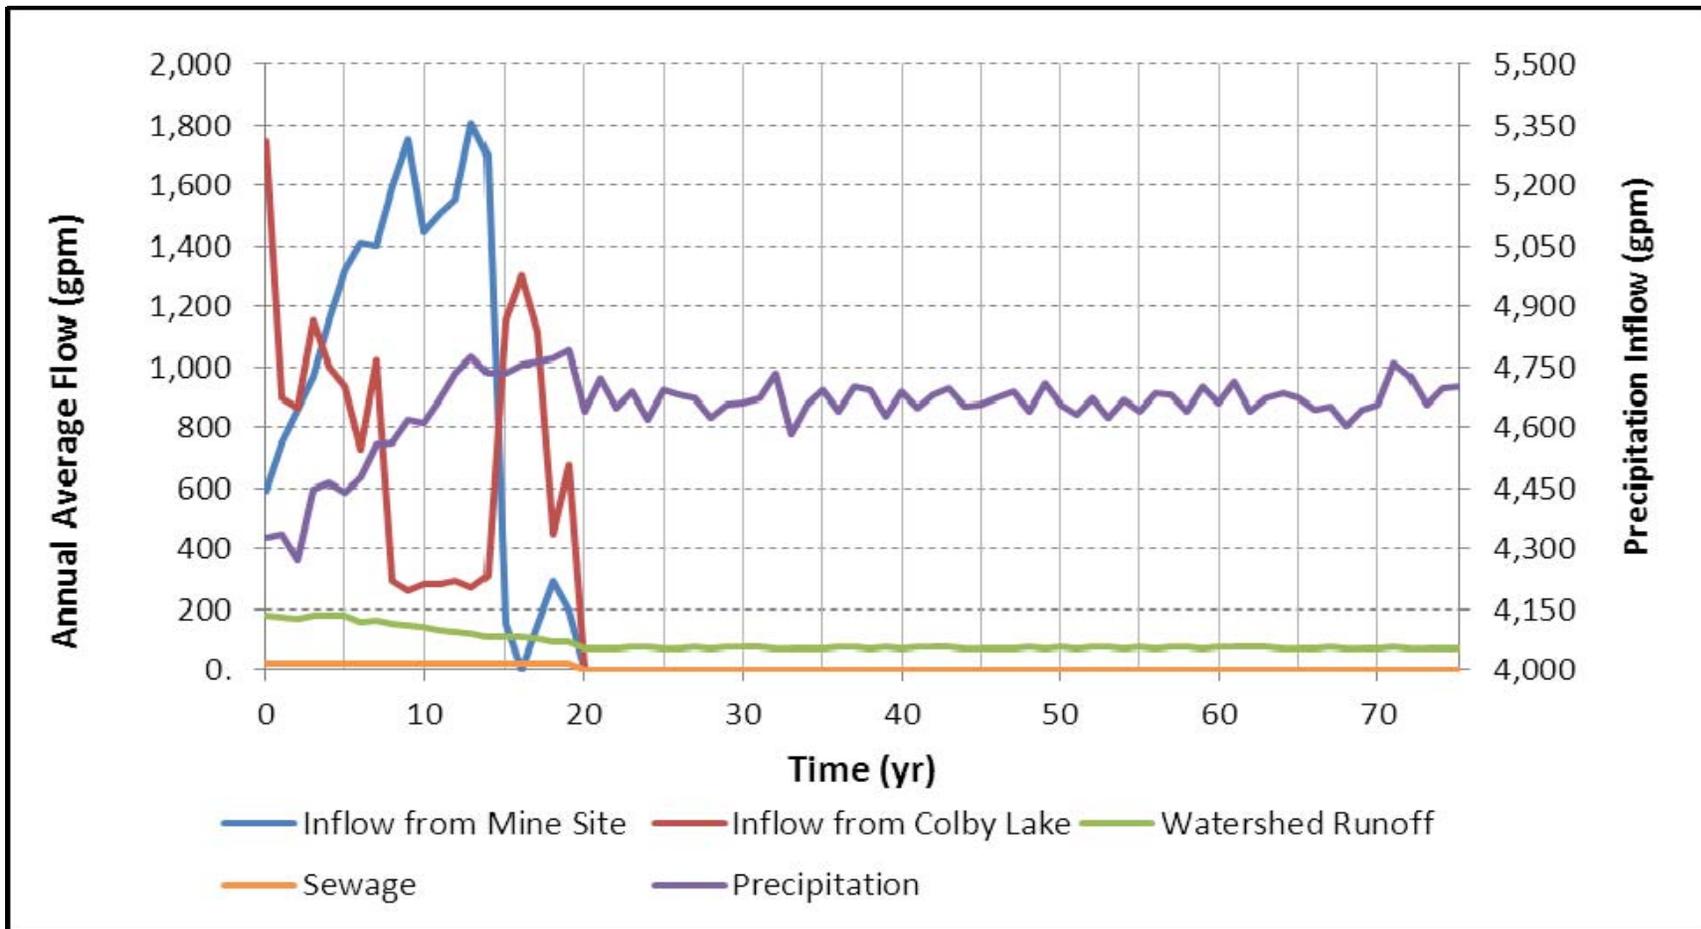

- Model Evaluation Point
- ← Water Discharge
- GW Groundwater
- SW Stomwater

Flows & loads to treatment

advantages of this approach

- holistic view of the water balance and how it changes
- rapid evaluation of design changes or changes in model assumptions – what-ifs
- conduct site-wide culpability and sensitivity analyses
- continuity of mass
- flexibility to address additional questions and evolving issues through the mine life cycle

water balance example

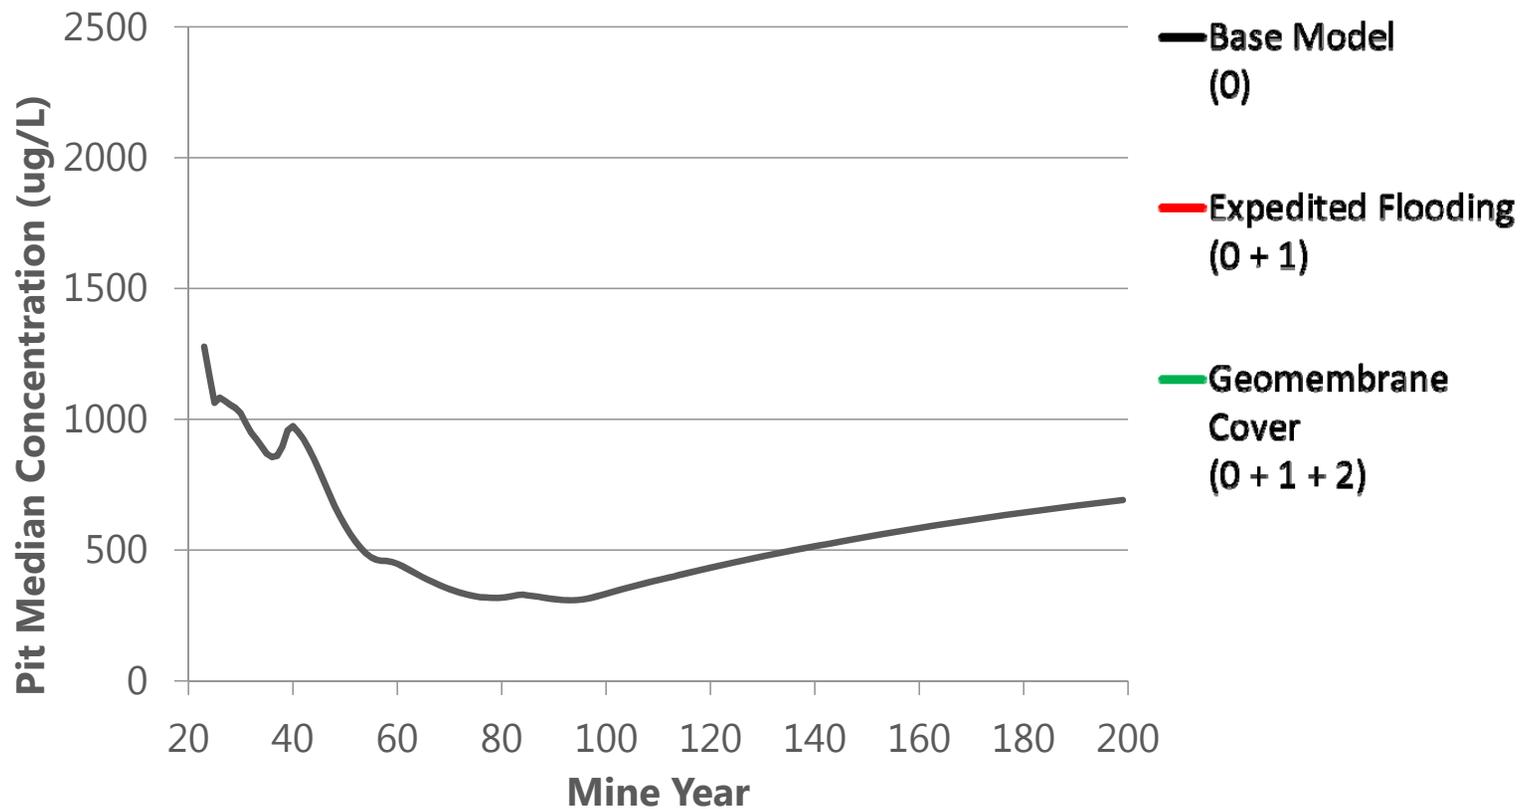

example of evaluation of design options

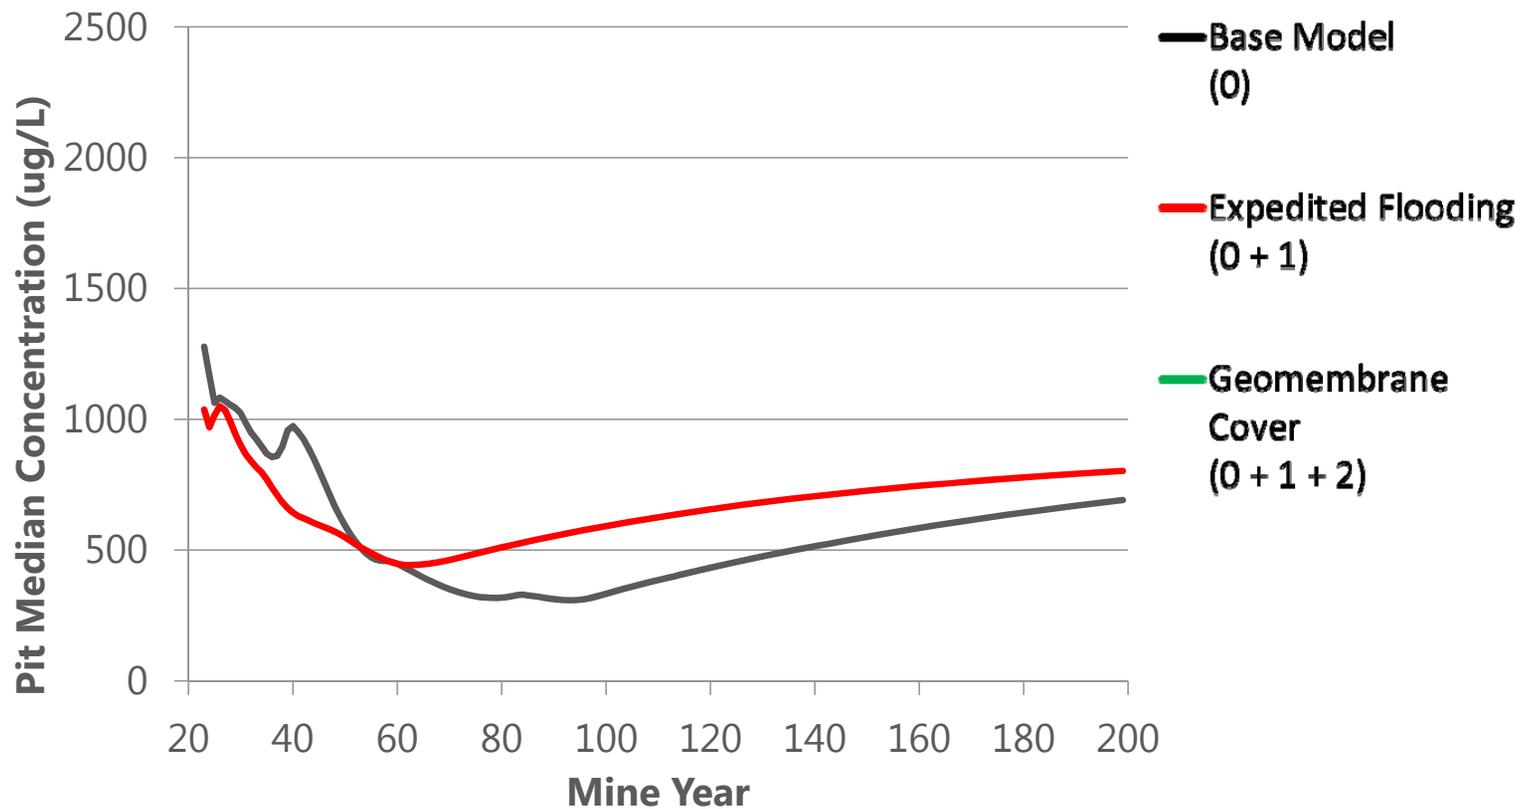

NorthMet Mine Site design options considered

- 1) expedited pit flooding
- 2) stockpile geomembrane cover

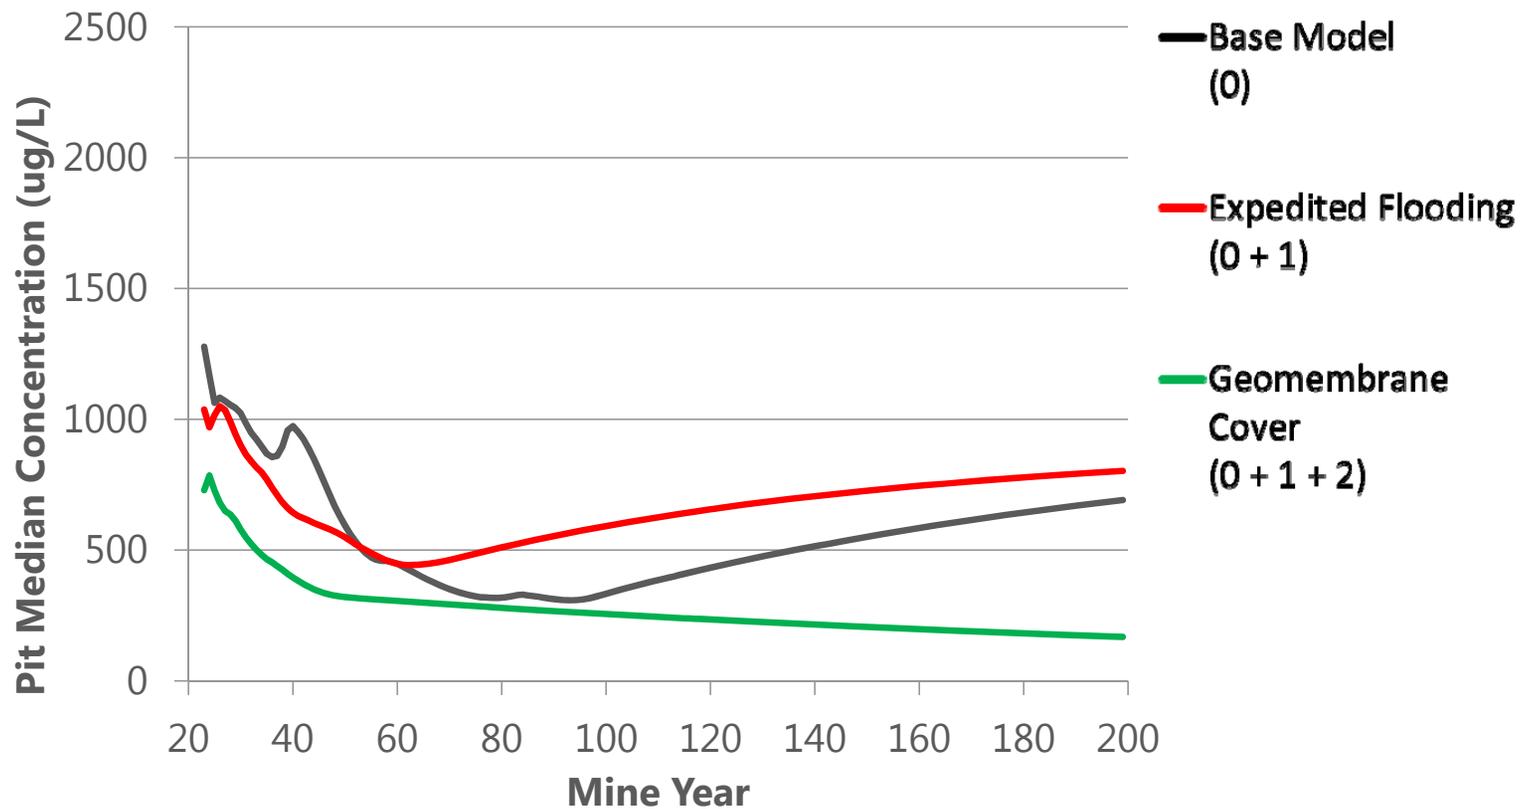

mine pit water quality

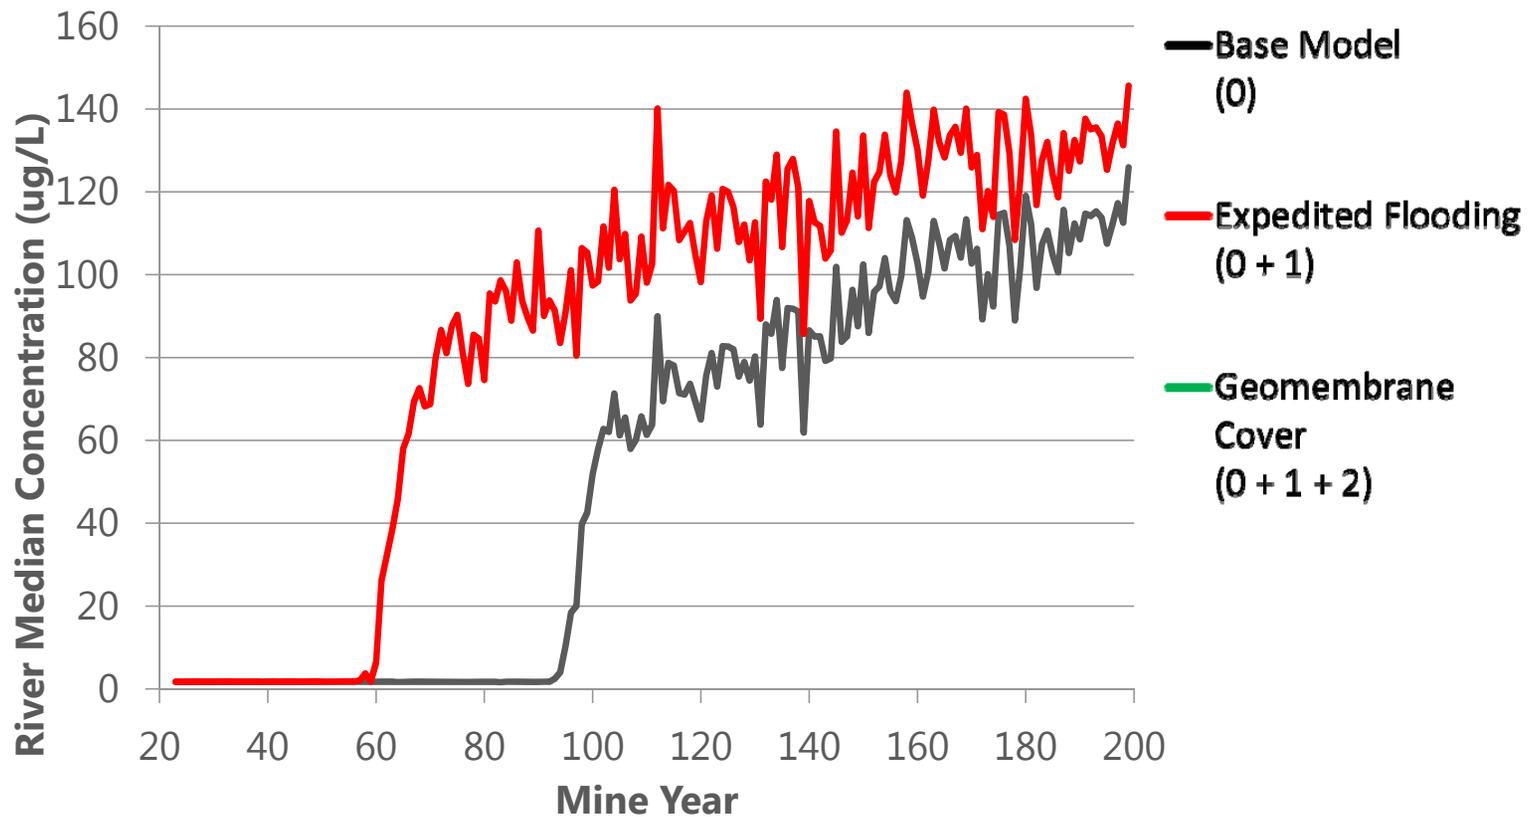

mine pit water quality

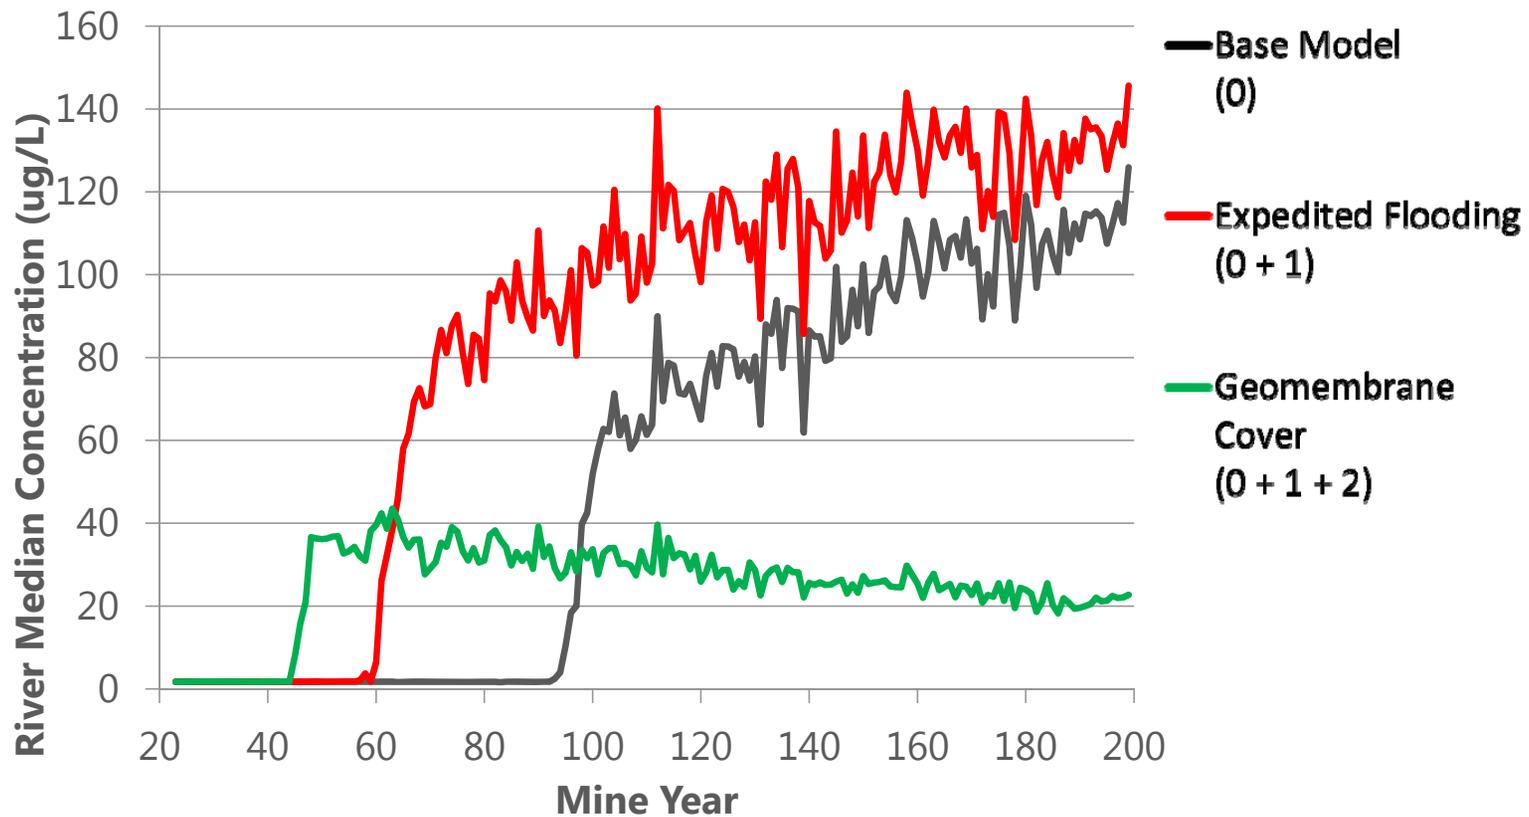

mine pit water quality

surface water receptor water quality

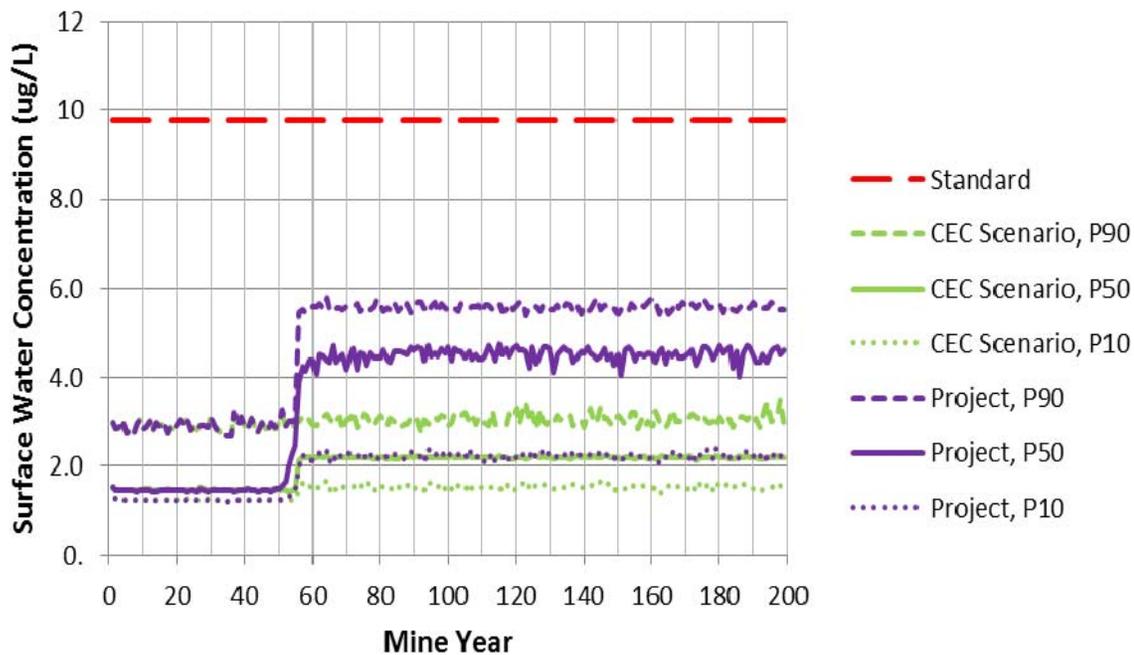

surface water receptor water quality

assess regulatory compliance considering uncertainty

Mine Site Version 6.0 Model
Annual Maximum of Concentration Statistics
Cu in the Partridge River at SW004a

- Predicted concentrations relative to water quality standards
- Presenting P10, P50 and P90 results
- Comparing No Action to Project

take home points

- mine water management plans can be complex and hard to understand if not looked at holistically
- the sooner you start to model the mine water, the more benefit you can get out of the model
- these don't have to be really complex, just right sized for the questions being asked
- mine water models are not just for regulatory compliance, they can be a useful tool for operators

the end.
